

Build It, Then Break It

Context Engineering

Corrected repository edition

Verification model: gpt-4.1-mini-2025-04-14

API temperature: 0.2

Evidence boundary: the original ChatGPT submission files are preserved under submission/original/. This corrected edition presents the active numerical-temperature API verification and does not relabel historical ChatGPT transcripts as API outputs.

Result

V1 passed 4/10 categories and broke on 6/10; two failures were critical. All six targeted V2 retests passed.

Conclusion

Money, identity, authorisation, private data, and durable cumulative state require deterministic controls outside the prompt.

API verification

Fabricated-authority and data-exfiltration critical retests were rerun three times each using gpt-4.1-mini-2025-04-14 at temperature 0.2. Six unedited JSON records are retained in verification/api-runs/.
